

2023 Fall Conference at Ashore Resort & Beach Club  
Ocean City, Maryland

**Sensored Evaluation of Permeable Pavement Performance:  
2 Year Case Study Results**

Dr. Aaron Fisher PhD

September 29, 2023

# BIOGRAPHY

- Dr. Aaron Fisher
  - PhD in Chemical Engineering from the University of Maryland
  - B.S. in Chemistry from Duke University
  - Vice President of Business Development for Ernest Maier
  - U.S. Department of Energy (contractor); Water Research Foundation; GlaxoSmithKline
  - Focused on sustainability and innovation around water, energy, manufacturing, and construction

# ABSTRACT

---

## Sensored Evaluation of Permeable Pavement Performance: 2 Year Case Study Results

- What is a Permeable Articulating Concrete Block permeable pavement?
  - How does this system differ from other permeable pavement options?
  - How can this system address stormwater challenges within the right-of-way?
  - Construction Process in Colmar Manor
  - Performance of the system over 2 years in Colmar Manor, MD
- 
- 1.0 PDH

A photograph of a street paved with permeable articulating concrete blocks. The blocks are arranged in a grid pattern with visible joints. The street is lined with parked cars and buildings. The sky is overcast.

# Permeable Articulating Concrete Blocks: Designed to Work with Water

- Matrix of interconnected concrete block units
- Form a Hard, yet Pervious Surface via Open Joints

# P-ACB and Pavers: Differences

	P-ACB	Pavers
Governing ASTM Standard	D6684	C936
Joints	Open	Filled
Interlocked	Yes	Sometimes
Bedding	57 Stone	89 Stone
Geofabrics	Required	Optional

# Permeable Surface Infiltration Rate Comparison

1,640 in/hr

Open Joints = High Infiltration Rates

Table 1: Summary of Infiltration Rates Tested of Various Surfaces

Surface Material	Infiltration rate (in/hr)	Mass of infiltrated water (lb)	Diameter of infiltration ring (in)	Time (sec)
P-ACB	1,640	40.0	12.187	19.53/18.42/24.53
Porous pavers	3.2	2.54	12.187	683
Porous concrete	2.4	3.80	12.187	1,380
Porous asphalt	3.1	5.58	12.187	1,515

# Permeable Roadway Options with ACBs

# About Colmar Manor

- Anacostia River's Historic Port Towns
- Town of 1500
- Low-lying, highly urbanized; Low-income community
- Challenged by poor drainage and pluvial flooding

# Colmar Manor, MD

**Owner:** Town of Colmar Manor, MD  
**Engineer:** Adtek Engineering  
**Manufacturer & Distributor:** Ernest Maier  
**Sensor:** P4 Infrastructure-INFIL-Tracker  
**Installation Contractor:** Capitol Hardscapes  
**Application:** Roadway Intersection  
**PaveDrain Quantity:** 2,350 Square Feet  
**Cost of System:** \$107,000  
 (including design and construction)

# Colmar Manor Cross Section

# Base Installation

# Soil

Sample	Depth [ft]	%Gravel	%Sand	%Silt	%Clay	Classification	USDA	K
1	1.5	0	14.6	54.6	30.8	Gray Silt	Silty Clay Loam	0.26 in/hr
2	2	0.2	86.7	7.2	5.9	Brown Silty Sand	Loamy Sand	3.85 in/hr
3	1	0	11.1	49.4	39.5	Gray Lean Clay	Silty Clay	0.18 in/hr

The mean saturated hydraulic conductivity of the 3 soils types is 1.43 in/hr and the geometric mean is 0.56 in/hr.

# INFIL Tracker Installation

# INFIL-Tracker Installation

# Example Data

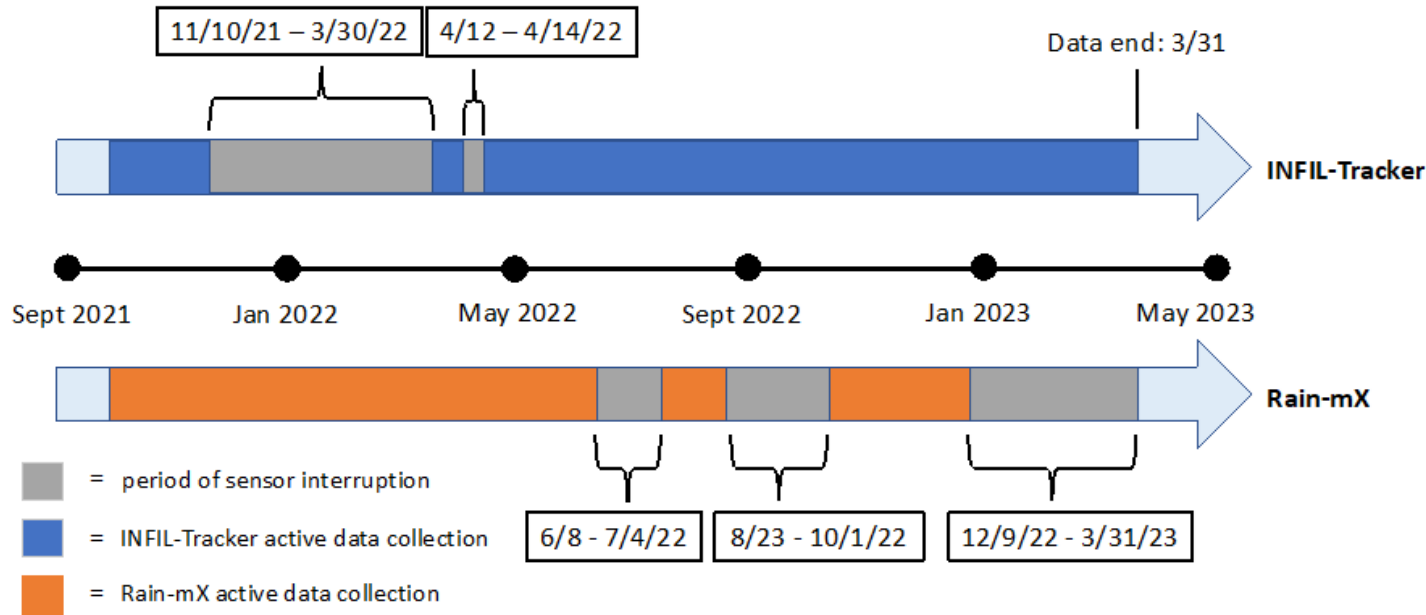

*What does the raw sensor data look like?*

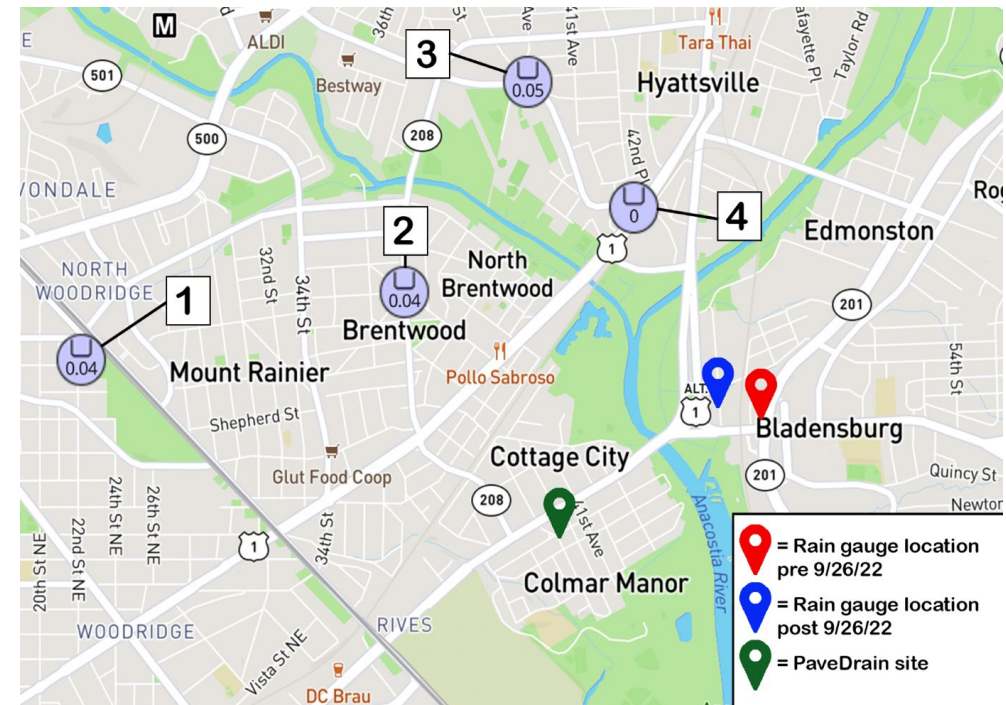

# Rainfall Gauges

**50 Storm Events in 2 Years**

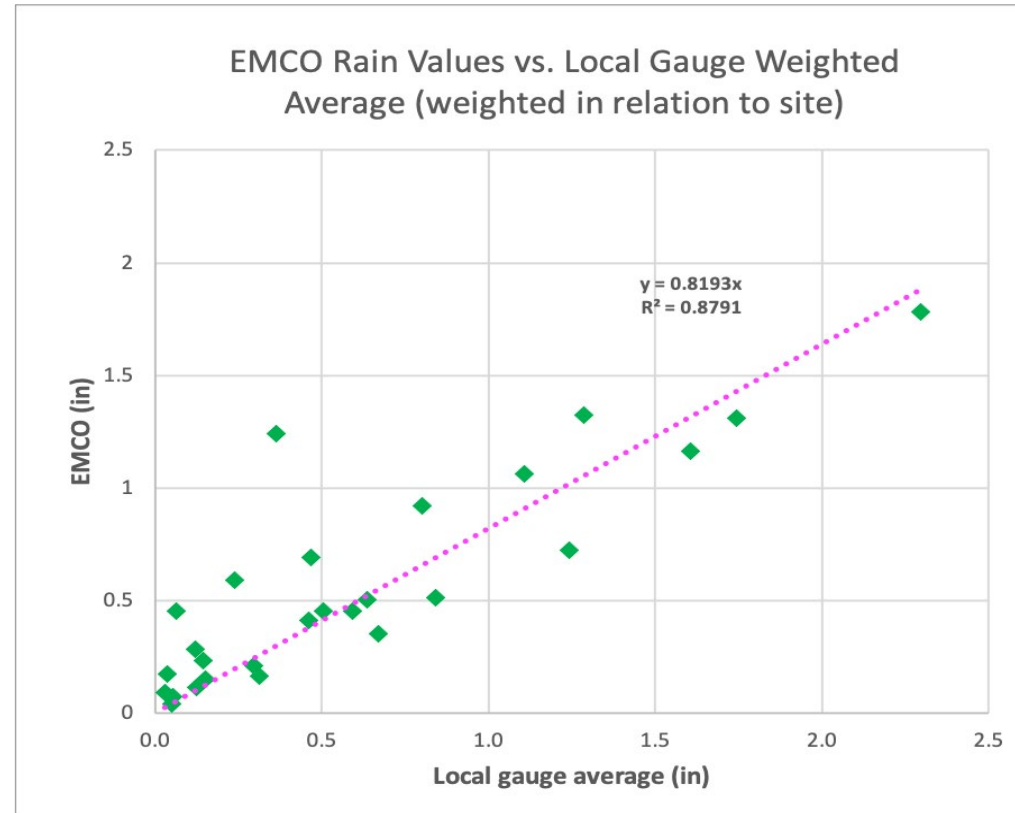

Over the course of the study, the largest 24-hr rain total measured 2.41 in, which corresponds to a return period of less than 1 year

# Rain Gauge Verification

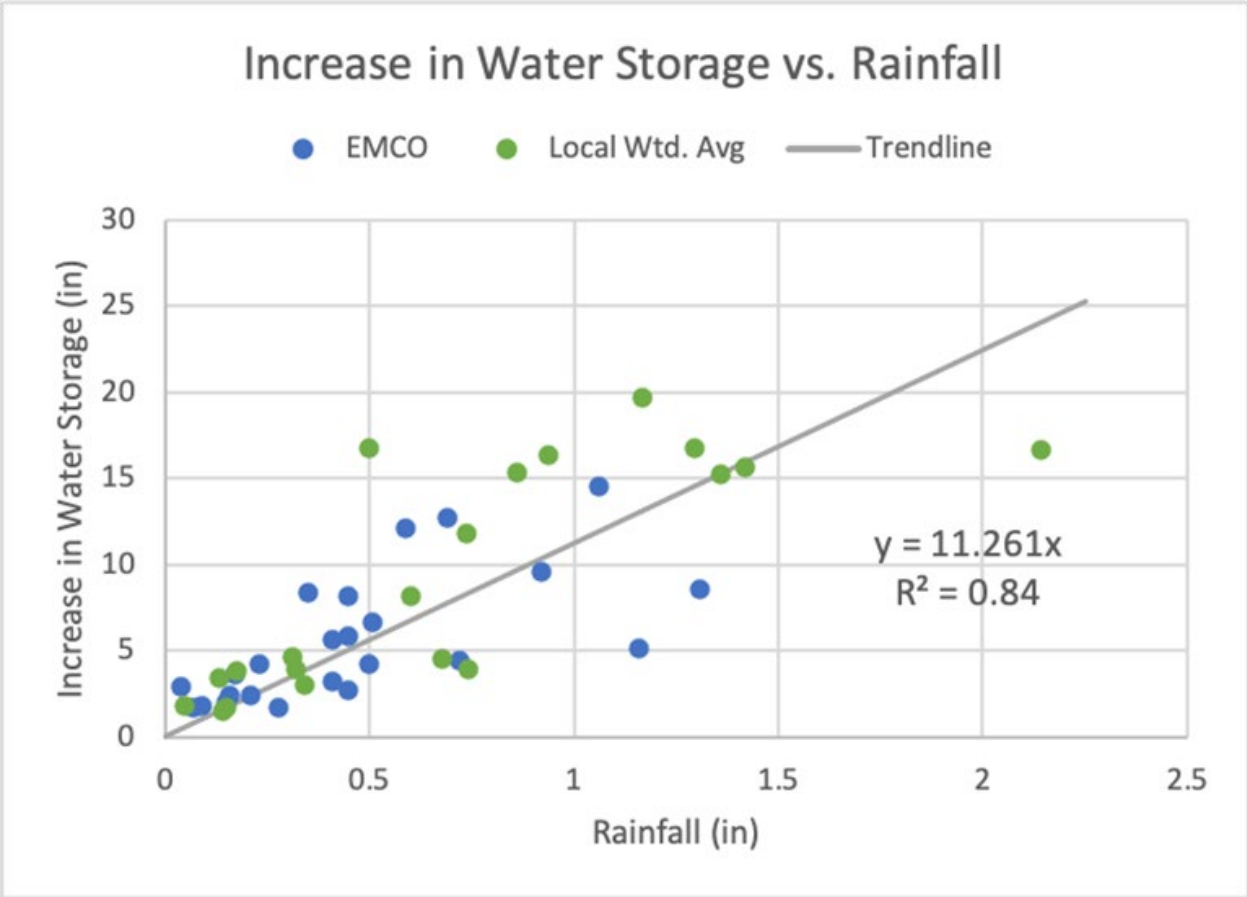

*How do we interpolate our local rain gauge with those slightly further?*

Scatter plot comparing EMCO rain values to distance-weighted average of 4 local rain stations

# Water Balance

*Correlating signal height to volume*

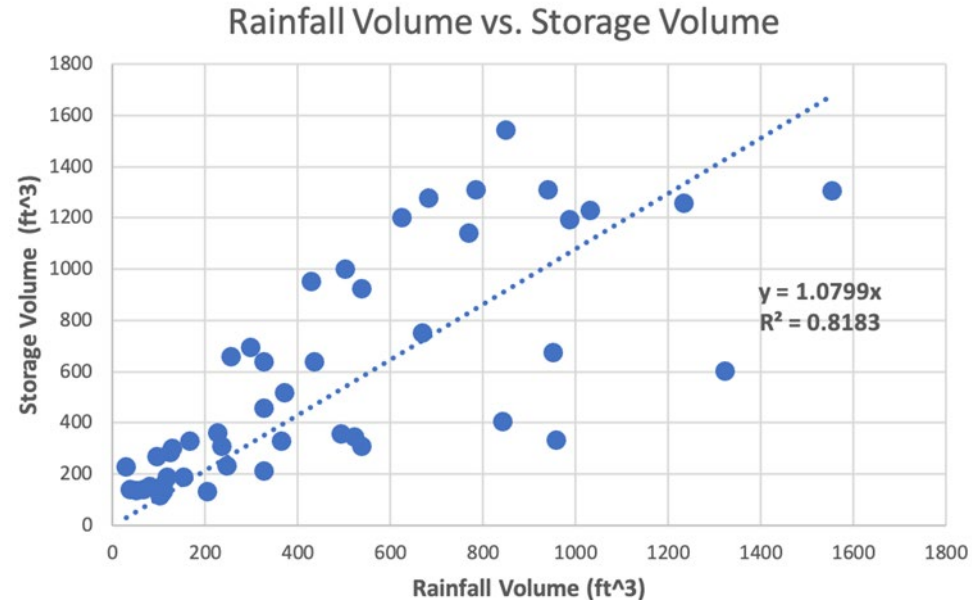

The total storage volume at the site is approximately 3630 ft<sup>3</sup> based on the available depth, area of 2350 ft<sup>2</sup> and a porosity of 0.4.

Plot of correlation between rainfall and increase in water storage

# Rainfall Volume vs Storage Volume

What is the run-on ratio?

$$\text{Run-on ratio} = \frac{A_{ro}}{A_p}$$

Volumetric water balance of water entering pavement system through rainfall and water draining from storage per storm event.

The slope is 783 ft<sup>3</sup>/in or 9400 ft<sup>2</sup>, equal to total drainage area  $A_d$ . With the pavement area,  $A_p$ , equal to 2350 ft<sup>2</sup>, the run-on area is calculated as 7050 ft<sup>2</sup> and the run-on ratio is 3.00. This value is 10.9% greater than the 6355 ft<sup>2</sup> of run-on area estimated during the facility design

# Static Storage

*What size storm could it handle (without exfiltration)?*

Estimated return periods (NOAA Atlas 14) for rainfall events exceeding 4.11 inches of rainfall over the entire drainage area at Colmar Manor, MD. The 90-percentile rainfall value is used to account for climate change.

Rainfall Duration (hrs)	Approximate Return Period for 4.11 in. Rainfall (yrs)
24	3.8
12	6.5
6	18
3	50
2	86
1	360

Return period is equal to the *average* time interval in which an event of this magnitude will occur. That is, a 3.8-year return period corresponds to an event that is expected, on average, to occur once every 3.8 years.

# Exfiltration from the Stone Base

*How quickly is the water leaving?*

# Soil Infiltration Rates

*What is the real soil infiltration rate?*

<b>Linear and Exponential Infiltration Rates (in/hr)</b>					
	<b>Range</b>	<b>Mean</b>	<b>Median</b>	<b>25th percentile</b>	<b>75th percentile</b>
<b>Linear</b>					
1-hr rates	0.12 - 5.34	1.04	0.50	0.23	1.57
2-hr rates	0.10 - 5.05	1.21	0.53	0.20	1.99
4-hr rates	0.08 - 3.00	0.89	0.78	0.18	1.08
<b>Exponential</b>					
1-hr rates	0.12 - 3.70	0.99	0.66	0.34	1.11
2-hr rates	0.10 - 3.89	1.13	0.59	0.34	1.78
4-hr rates	0.10 - 2.35	0.92	0.58	0.33	1.45

The observed mean 1-hr exponential infiltration rate of 0.99 in/hr is 0.44 in/hr less than the mean and 0.33 in/hr greater than the geomean.

“Though the subsurface soil was classified based on the lowest hydrologic group (D for soil at the PaveDrain site), it is recommended that for stormwater BMP site selection that soil borings are analyzed to reflect the infiltration potentials for all types of soils found on site.”

# Dynamic Storage

(Filling a Bucket with a Hole)

*What size storm could it handle?*

Rainfall Duration (hrs)	Exfiltration (in)	Total Rainfall Depth Managed (in)	Approximate Return Period (yr)
24	1.39	5.50	11.4
12	0.70	4.81	12.8
6	0.35	4.46	25
3	0.17	4.28	65
2	0.12	4.23	100
1	0.06	4.17	390

Estimated return periods (NOAA Atlas 14) for rainfall events exceeding 4.11 inches of rainfall over the entire drainage area with exfiltration at Colmar Manor, MD. The 90-percentile rainfall value is used to account for climate change.

# Pollutant Load Reduction

*What is the environmental value of the system?*

Annual Value of Nutrients Removal by the PaveDrain System				
	5.3.0		5.3.2	
Total Nitrogen	2.33 lbs	\$3,646	3.28 lbs	\$5,141
Total Phosphorus	0.44 lbs	\$4,241	0.36 lbs	\$3,470
Total Sediment	0.10 tons	\$9,555	0.09 tons	\$8,600
Total		<b>\$17,442</b>		<b>\$12,481</b>

**Payback: 6.13 years – 8.57 years**

# BEST ULTRA-URBAN BMP FINALIST

- 2 years worth of storms;  
Never more than 50% full
- Biggest 1-day storm  
handled: 2.41 in. (August  
5, 2022)
- Ability to handle 5.50  
in/day (1 in 11.4 years;  
90-percentile value)
- No maintenance

The highest recorded water storage level across all storm events was 23.33 inches on 9/21/21 during a rain event of magnitude of 1.32 inches (24-hr total).

# Other P-ACB Benefits

- Never have to replace joint filler (sand/stone dust)
- High void space avoids freeze-thaw and frost heaving challenges
- Can seal after installation to prevent salt damage
- Able to function in high water levels (e.g., sunny day flooding)
- Long lifetime of concrete (40 years)
- Single person can replace an ACB unit with a block extractor
- Increases resiliency of traditional paving surfaces
